CDI Ignition Schematic Circuit Diagram

A CDI ignition starts by generating a charge and storing it up before sending it out to the spark plug in order to ignite the engine. This power passes through a capacitor and is transferred to an ignition coil that helps boost the power by acting as a transformer and allowing the energy pass through it instead of catching any of it.

How Capacitor Discharge Ignition (CDI) system Works and ...

A typical CDI module consists of a small transformer, a charging circuit, a triggering circuit and a main capacitor. First, the system voltage is raised up to 250 to 600 volts by a power supply inside the CDI module. Then, the electric current flows to the charging circuit and charges the capacitor.

In a 4-stroke, 4-cylinder engine (as shown in the diagram), for every 1000 revolutions of the engine, the ignition cycle will be completed 2000 times. For more information on the individual components in a points/condenser ignition system, see the separate articles in the Components Explained section.

The Classic Mechanic: Points/Condenser Ignition Explained

In an ignition coil, for instance, the primary coil energized by, say, a six volt battery would have relatively few windings, and the secondary coil would have thousands of times more windings of very small diameter wire in order to get the 15,000 to 25,000 volts needed to jump the gap in the spark plug.

Replacement modules are available for many small engines to take the place of their original point type ignition system. These can be designed in several different ways but all must emulate the behavior of the point type ignition replacing just the magneto coil/pole piece assembly and without requiring alterations to the flywheel.

What is inside a small engine electronic ignition module?

An ignition coil (or spark coil) is nothing more than a low frequency auto-transformer with a relatively high turns ratio. The transformer typically has only a dozen or so turns on the primary but many thousands on the secondary. It is very comparable in design to the pulse transformers used in other appliances such as fence chargers, well suited for high voltage bursts.
